Contents

1 INTRODUCTION **4**
1.1 Motivation . . . 4
1.2 Problem Statement . . . 4
1.3 Research Questions and Contribution . . . 4
1.4 Overview of content . . . 4

2 LITERATURE REVIEW **4**
2.1 Model learning in robotics . . . 4
2.2 Classical and recent works in system identification . . . 4
2.3 Local and global models linear models . . . 4
2.4 End-to-end learning (black box models) . . . 4
2.5 Data-driven learning with structure information . . . 4
2.6 Model learning and the body schema . . . 4
2.6.1 Sensorimotor learning . . . 4

3 THEORETICAL FRAMEWORK **4**
3.1 Robot equations of motion . . . 4
3.1.1 Forward and inverse dynamics . . . 4
3.1.2 The Newton-Euler formulation of the inverse dynamics . . . 4
3.1.3 Composition of the kinematics and dynamics . . . 4
3.2 Basics of robot system identification . . . 4
3.2.1 Kinematic calibration . . . 4
3.2.2 Inertial parameter identification . . . 4
3.3 Robot proprioception . . . 4
3.3.1 What is proprioception for? . . . 4
3.3.2 Comparison between human and robot proprioception . . . 4
3.3.3 A sensor suite for robot proprioception . . . 4
3.4 State-of-the-art Gradient Descent . . . 4
3.4.1 Fundamentals . . . 4
3.4.2 Momentum gradient descent . . . 4
3.4.3 ADAM gradient descent . . . 4
3.4.4 AMS gradient descent . . . 4
3.5 Fundamentals of graph theory . . . 4
3.5.1 What is a graph? . . . 4

3.5.2 Graph representation, the adjacency matrix 4
3.5.3 Metrics for graph comparison 4
3.6 Network topology inference 4
3.6.1 Based on covariance 4
3.6.2 Based on GSP 4
3.6.3 Base on statistics 4
3.7 Information theory 4
3.7.1 What is information? 4
3.7.2 The entropy of a random variable 4
3.7.3 Mutual Information: The correlation of the 21st century 4
3.8 Differential geometry 4
3.8.1 Fundamentals of differential geometry 4
3.8.2 Manifolds and the tangent space 4
3.8.3 Riemannian geometry and the metric 4
3.8.4 Use in robotics 4

4 METHODOLOGY 4
4.1 First-order principles networks 4
4.2 Signal requirements 4
4.2.1 The importance of robot proprioception 4
4.3 Leveraging data history 4
4.3.1 Replay buffer 4
4.3.2 Reservoir sampling 4
4.4 Embodiment and mutual information 4
4.4.1 Online computation of the pairwise mutual information . 4
4.4.2 Handling scalar and vector relationships 4
4.4.3 Assessing convergence 4
4.5 Exploratory motions 4
4.5.1 Motor babbling 4
4.5.2 Excitation trajectories 4
4.6 Network topology inference using mutual information 4
4.6.1 Finding the adjacency matrix 4
4.6.2 The proprioceptive information graph 4
4.6.3 Inferring the mechanical topology 4
4.7 Kinematic description guided from topology and proprioceptive measurements 4
4.7.1 Validating bod-body and body-joint connections 4
4.7.2 Finding the sensor-to-sensor orientations 4
4.7.3 Finding the joint center point 4
4.7.4 Learning the kinematics 4
4.8 Online learning inertial parameters 4
4.8.1 Gradient decent for inverse dynamics 4
4.8.2 Constraints for physical feasibility 4
4.8.3 Riemannian AMS gradient descent 4
4.8.4 The effect of six dimensional force/torque measurements . 4
4.8.5 Alternatives to joint acceleration 4

5 RESULTS **4**
5.1 The topology of a robotic arm 4
5.1.1 Contrasting fixed and floating base 4
5.1.2 Comparison with alternative NTI methods 4
5.1.3 Experiment on a physical robot 4
5.2 More complex structures 4
5.2.1 A hexapod robot 4
5.2.2 A humanoid robot 4
5.3 Learning the kinematics 4
5.3.1 Learning of the Denavit-Hartenberg parameters 4
5.3.2 Learning the Euler angles 4
5.3.3 Learning axis orientation and joint center point 4
5.4 Learning the inertial parameters 4
5.4.1 Learning the inertial parameters with offline optimization 4
5.4.2 Learning the inertial parameters with ADAM gradient decent 4
5.4.3 Learning the inertial parameters with Riemannian AMS gradient descent 4

6 DISCUSSION **4**
6.1 Dealing with multiple DoF joints 4
6.2 Analysis of the different sensor types and their potential 4
6.3 The influence of a moving base 4
6.4 The effect of noise 4
6.5 Sample efficiency 4
6.6 Limitations 4

7 CONCLUSION **4**
7.1 Summary 4
7.2 Perspectives 4
7.3 Impact 4

1 INTRODUCTION

1.1 Motivation

1.2 Problem Statement

1.3 Research Questions and Contribution

1.4 Overview of content

2 LITERATURE REVIEW

2.1 Model learning in robotics

2.2 Classical and recent works in system identification

2.3 Local and global models linear models

2.4 End-to-end learning (black box models)

2.5 Data-driven learning with structure information

2.6 Model learning and the body schema

2.6.1 Sensorimotor learning

3 THEORETICAL FRAMEWORK

3.1 Robot equations of motion

3.1.1 Forward and inverse dynamics

3.1.2 The Newton-Euler formulation of the inverse dynamics

3.1.3 Composition of the kinematics and dynamics

3.2 Basics of robot system identification

3.2.1 Kinematic calibration

3.2.2 Inertial parameter identification

3.3 Robot proprioception

3.3.1 What is proprioception for?

3.3.2 Comparison between human and robot proprioception

3.3.3 A sensor suite for robot proprioception

3.4 State-of-the-art Gradient Descent

3.4.1 Fundamentals

3.4.2 Momentum gradient descent

3.4.3 ADAM gradient descent

3.4.4 AMS gradient descent

3.5 Fundamentals of graph theory

3.5.1 What is a graph?

3.5.2 Graph representation, the adjacency matrix

3.5.3 Metrics for graph comparison

3.6 Network topology inference
